PORTFOLIO DOCUMENT · REACT NATIVE

Hamza Shehzad

I design and build mobile apps that feel calm, clear, and ready for real users — for founders who need an MVP, and teams who already have a backend waiting for a front door.

A NOTE BEFORE THE WORK

Built for founders who want clarity, not jargon.

If you have an idea for an app — or an API that needs a beautiful, reliable mobile layer — this document is for you. It is not a rate sheet. It is a careful look at three production apps I have shipped, and the way I think about building the next one with you.

Most founders I work with are not engineers. You care about whether people can open the app, find what they need, and trust it enough to come back. My job is to translate that into a React Native product that feels intentional on both iOS and Android — without drowning you in technical fog.

Startups that already have a backend are often stuck at the last mile: the mobile experience. I connect cleanly to your existing APIs, design the flows your users actually take, and ship something you can put in a store — or hand to a pilot group — with confidence.

> Plan deep. Code smart. Evolve constantly.

That is the short version of how I work. We take time to understand the problem before we write a single screen. We choose simple architecture over clever shortcuts. And we leave room for the product to grow after launch — because the first version is rarely the last.

HOW WE WORK TOGETHER

A calm path from idea to App Store.

No mystery process. Four stages, plain language, shared visibility at every step. You always know what is being built and why.

01

Clarify

We map who the app is for, what success looks like on day one, and what can wait. Screens, flows, and edge cases — sketched before they become expensive surprises.

02

Build

React Native for iOS and Android from one codebase. Thoughtful UI, steady performance, and APIs wired the way your backend expects — or helped into shape if it is still forming.

03

Ship

Store-ready builds, testing on real devices, and a release you can show investors, customers, or your team without apology.

04

Iterate

After launch, we listen. Small improvements compound. I stay available to refine, extend, and keep the product healthy as usage grows.

CASE STUDY 01

RedLife

A life-critical community app connecting blood donors, recipients, and blood banks across Pakistan.

Role Full-stack mobile developer **Platform** iOS & Android **Focus** Reliability under urgency

The problem

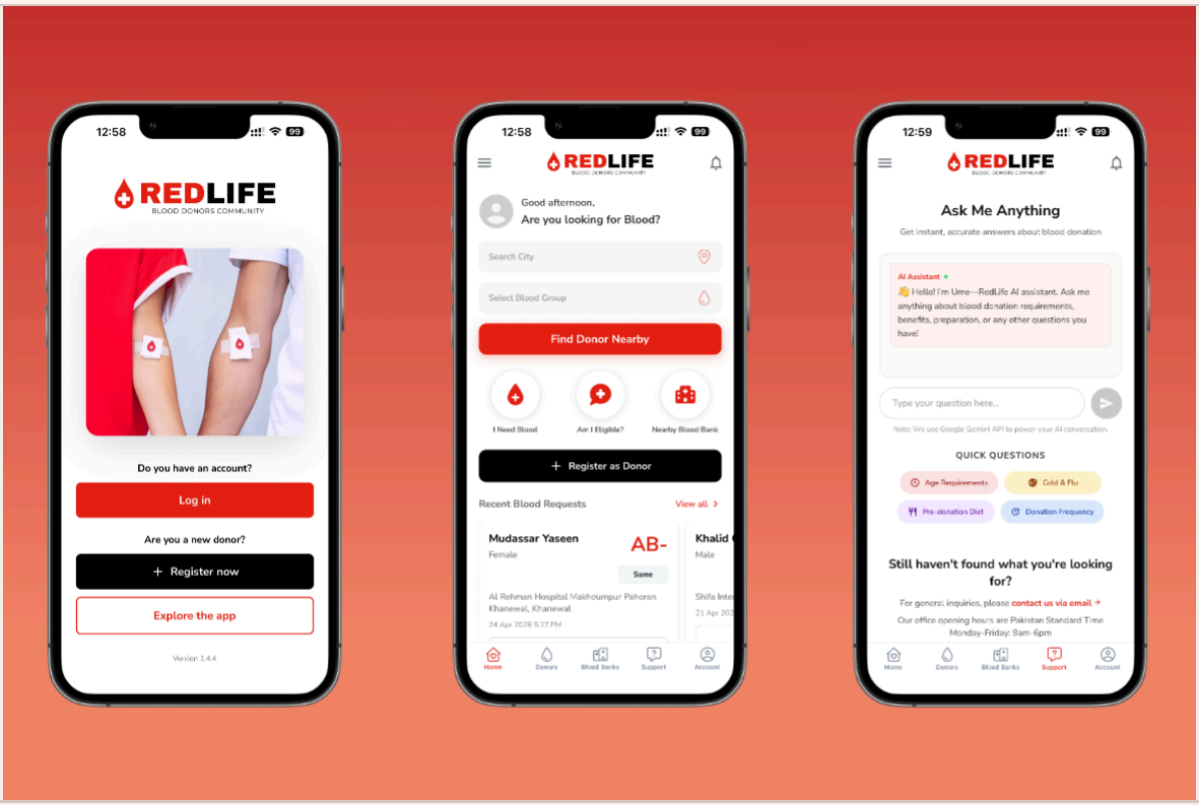

When someone needs blood, minutes matter. RedLife had to feel fast and trustworthy — not like a brochure, and not like a fragile prototype. Donors, recipients, and blood banks needed one place to find each other without friction, especially in moments of stress.

What I built

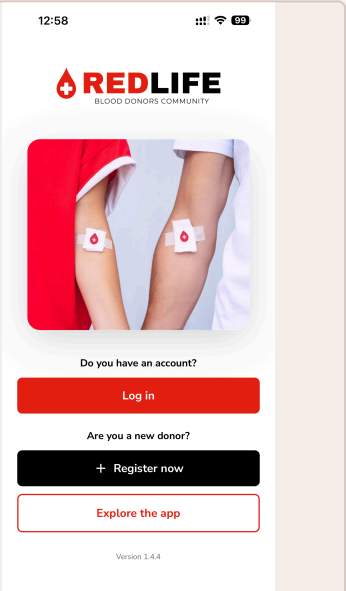

I architected a cross-platform React Native app with a clear focus on performance and reliability, backed by a Laravel API and MySQL. The work spans mobile and web surfaces that share the same source of truth — so emergency access stays consistent wherever someone reaches for help.

The design priority was calm clarity: large tap targets, readable hierarchy, and flows that do not ask a panicked user to hunt for the next step. Real-time concerns were treated as product requirements, not afterthoughts.

CASE STUDY 02

Markaz Agent

A property and agency management app that keeps listings, inquiries, and day-to-day operations in one place.

Role React Native / web developer **Client** Markaz.pk **Focus** High-traffic operations

The problem

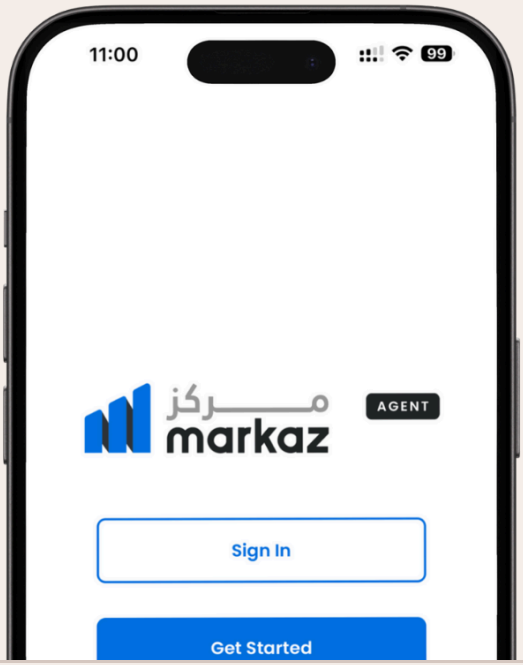

Real-estate agencies juggle listings, conversations, and admin work across tools that rarely talk to each other. Agents needed a mobile companion that felt as capable as the desk — without becoming a maze of menus.

What I built

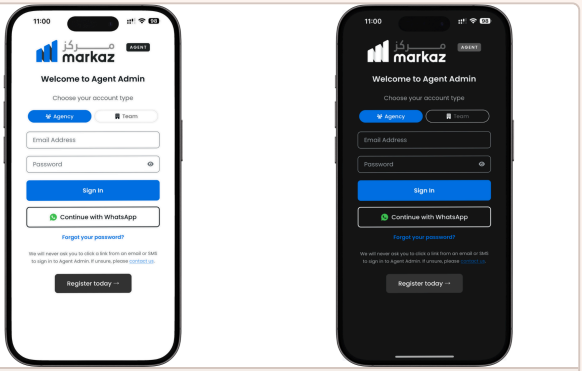

I build and maintain a high-traffic React Native app with strong database connectivity and a performance-first mindset. Alongside the mobile experience, I lead feature work inside a complex admin dashboard used by content managers — so the field and the office stay aligned.

For founders watching this case: Markaz Agent is what "serious operations software" looks like when it still has to feel approachable on a phone. The craft is in the quiet details — loading states, list density, inquiry flow — not in loud decoration.

CASE STUDY 03

PK Domains

A polished, minimal marketplace for buying and selling .pk domains — built as a first-of-its-kind mobile experience in Pakistan.

Role Mobile product builder **Category** Marketplace **Focus** Trust & simplicity

The problem

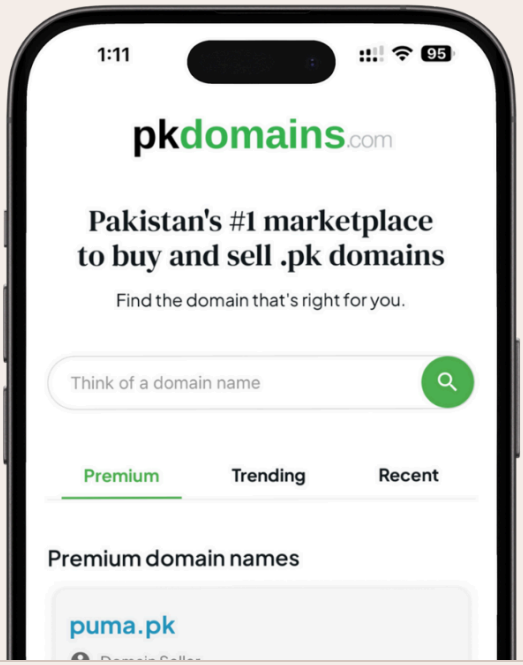

Domain marketplaces fail when they feel opaque. Buyers need to believe a listing is real; sellers need a path that does not feel like paperwork. On mobile, that trust has to arrive in the first few screens — or the session ends.

What I built

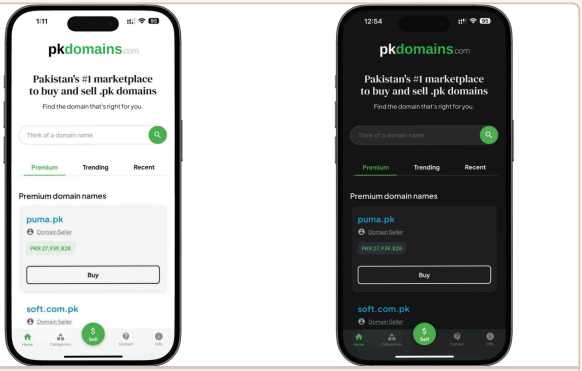

PK Domains is a React Native marketplace with a deliberately quiet visual language: generous spacing, restrained colour, and flows that favour scanning over spectacle. Underneath, MySQL-backed data keeps inventory and transactions organised for a category that had little mobile precedent locally.

This is the kind of MVP I enjoy most — a clear niche, a real user need, and enough polish that the first impression matches the ambition of the idea.

STACK & CRAFT

Tools chosen for shipping, not showing off.

You do not need to memorise this list. Think of it as the kitchen I cook in — proven ingredients, selected so your product stays maintainable after launch.

LANGUAGES	TypeScript · JavaScript · PHP
MOBILE & UI	React Native · React · Next.js
BACKEND	Node.js · Laravel · Express
DATA	MySQL · PostgreSQL
CRAFT	Vite · Tailwind · Figma · Git
SHIP	Vercel · cPanel · Docker

If your backend already exists, I meet it where it is. If it does not, I can help shape a lean API that your app — and your future web surface — can grow on.

FIELD NOTES

Where the craft has been practiced.

Recent work, stated plainly. These are the teams and products that shaped how I show up for freelance partners today.

JAN 2026 – PRESENT · PART TIME

RedLife

Full-stack mobile developer

- Architecting a cross-platform React Native app for iOS and Android with a focus on performance and reliability.
- Maintaining and extending a Laravel backend so mobile and web stay in sync through scalable APIs.

FEB 2025 – PRESENT · PART TIME

Markaz.pk

React Native app / web developer

- Building and maintaining a high-traffic React Native app with strong database connectivity.
- Leading feature development inside a complex admin dashboard for content managers.

OCT 2023 – APR 2024 · INTERNSHIP

GRIPHENS Technologies

Full stack developer

- Shipped production websites in WordPress, Webflow, and React from real UI/UX specs.
- Handled back-end work and third-party API integrations through end-to-end client delivery.

Currently studying Software Engineering at SZABIST · Based in Islamabad, open to freelance partnerships.

NEXT STEP

Ready when you are.

If one of these case studies feels close to what you need — an MVP, a marketplace, an ops companion, a life-critical flow — tell me about your idea. I read every message.
